We recommend all clinicians follow the CDC’s guidance on pregnant healthcare providers and immunocompromised healthcare providers:

**CDC updates on pregnant healthcare providers and COVID-19:** The CDC is recommending that pregnant, immunocompromised or immunosuppressed healthcare providers follow the same guidelines for infection prevention and control as all providers with regard to COVID-19. Because the effect of COVID-19 infection in pregnancy is unknown, the CDC further advises that pregnant healthcare workers should minimize contact with COVID-19+ patients as staffing allows. Because of conservation of PPE, many programs have already triaged HCPs with COVID+ patients. We recommend that pregnant HCP be considered when these triage determinations are made.

**Healthcare providers with potential increased risk from infection:** HCPs with chronic heart disease, chronic lung disease, and immune-suppression, either due to an underlying condition or immunosuppressive medication use, are likely to be at increased risk of severe disease secondary to SARS-CoV2 infection. Trainees in these categories are encouraged to contact their program directors to explore non-patient facing rotation options such as telemedicine electives as long as staffing permits. Trainees are not expected to disclose any details about their medical conditions to program leadership. This guidance may be adjusted as workforce needs evolve, or if the CDC updates their recommendations for these HCPs.
